Adventus Mining and Salazar Announce First Batch of Drilling Results for El Domo Underground – Including 6.91 metres of 6.17% Copper Equivalent

Toronto, October 17, 2022 – Adventus Mining Corporation (“Adventus Mining”) (TSX-V: ADZN, OTCQX: ADVZF) and Salazar Resources Limited (“Salazar”) (TSX-V: SRL, OTCQB: SRLZF) (collectively the “Participants”) are pleased to announce the first infill drilling results from the El Domo volcanogenic massive sulphide deposit (“El Domo”) located within the 21,537-hectare Curipamba project in central Ecuador. The infill drilling program for the underground portion of the Mineral Resource at El Domo, as announced in the August 29, 2022 press release, continues with two diamond drill rigs. To date, 15 of 48 definition drill holes having been successfully completed totaling 3,388 metres from the planned 12,000 metres, and two drill holes in progress totaling a further 435 metres completed. Separately, two geotechnical and two hydrogeological related drills also continue to operate to support the detailed engineering for the El Domo open pit.

Highlights – Drill Results from the El Domo Deposit at Curipamba:

- CURI-394 intersected 6.91 metres of 3.00% copper, 1.55 g/t gold, 7.64% zinc, 34.0 g/t silver, and 0.11% lead for 6.17% copper equivalent – including 3.97 metres of 4.67% copper, 1.40 g/t gold, 11.87% zinc, 43.4 g/t silver, and 0.14% lead for 9.14% copper equivalent (“CuEq”)
- CURI-392 intersected 6.85 metres of 2.70% copper, 4.26 g/t gold, 2.54% zinc, 70.5 g/t silver, and 0.40% lead for 5.38% CuEq – including 1.88 metres of 9.02% copper, 10.10 g/t gold, 4.99% zinc, 172.5 g/t silver, and 0.36% lead for 14.51% CuEq
- CURI-393 intersected 5.42 metres of 2.18% copper, 1.12 g/t gold, 5.93% zinc, 78.8 g/t silver, and 0.03% lead for 4.62% CuEq – including 2.84 metres of 2.70% copper, 1.69 g/t gold, 10.73% zinc, 37.0 g/t silver, and 0.03% lead for 7.36% CuEq

Drill hole CURI-392 intersected a thick section of semi-massive to massive sulphide from 175.72 to 182.57 metres, grading 2.70% copper, 4.26 g/t gold, 2.54% zinc, 70.5 g/t silver, and 0.40% lead. A higher-grade subset was intersected from 176.32 to 178.20, grading 9.02% copper, 10.10 g/t gold, 4.99% zinc, 172.5 g/t silver, and 0.36% lead. A pyrite- and gold-rich interval was intersected from 180.26 to 182.57 metres, grading 0.18% copper, 2.43 g/t gold, 1.45% zinc, 40.8 g/t silver, and 0.33% lead.

| Drill Hole | From (m) | To (m) | Thickness (m) | Cu (%) | Au (g/t) | Zn (%) | Ag (g/t) | Pb (%) | Copper Equivalency (%) ^{(1) (2)} | Approx. True Thickness (m) |
|------------------|----------|--------|---------------|--------|----------|--------|----------|--------|-------------------------------------------|----------------------------|
| CURI-392 | 175.72 | 182.57 | 6.85 | 2.70 | 4.26 | 2.54 | 70.5 | 0.40 | 5.38 | 6.17 |
| <i>including</i> | 176.32 | 178.20 | 1.88 | 9.02 | 10.10 | 4.99 | 172.5 | 0.36 | 14.51 | 1.69 |
| <i>including</i> | 180.26 | 182.57 | 2.31 | 0.18 | 2.43 | 1.45 | 40.8 | 0.33 | 2.20 | 2.08 |

(1) Metal equivalency based on US\$3.43/lb Cu, US\$1,676/oz Au, US\$1.32/lb Zn, US\$18.43/oz Ag and US\$0.93/lb Pb. Prices taken from 6-month contracts for precious metals and 3-month contracts for base metals from the London Metal Exchange, dated October 14, 2022.

(2) Metal equivalency adjusted for metal recoveries based on detailed metallurgical data from Feasibility Study filed on SEDAR, effective data October 26, 2021. The report is titled – “NI 43-101 Technical Report, Feasibility Study, Curipamba El Domo Project, Central Ecuador”.

CURI-393 intersected massive sulphide mineralization from 71.90 to 77.32 metres, grading 2.18% copper, 1.12 g/t gold, 5.93% zinc, 78.8 g/t silver and 0.03% lead. A higher-grade subset was intersected from 74.48 to 77.32, grading 2.70% copper, 1.69 g/t gold, 10.93% zinc, and 37.0 g/t silver and 0.03% lead.

(2) Metal equivalency adjusted for metal recoveries based on detailed metallurgical data from Feasibility Study filed on SEDAR, effective data October 26, 2021. The report is titled – “NI 43-101 Technical Report, Feasibility Study, Curipamba El Domo Project, Central Ecuador”.

Drill hole CURI-394 intersected semi-massive to massive sulphide mineralization from 142.42 to 149.33 metres, grading 3.00% copper, 1.55 g/t gold, 7.64% zinc, 34.0 g/t silver, and 0.11% lead. A higher-grade subsection occurs from 144.38 to 148.35 metres, grading 4.67% copper, 1.40 g/t gold, 11.87% zinc, 43.4 g/t silver and 0.14% lead. A section of mineralized footwall felsic autoclastic volcanic rocks was intersected from 188.90 to 195.32 metres, grading 0.12% copper, 0.70 g/t gold, 0.25% zinc, and 11.3 g/t silver and 0.48% lead.

| Drill Hole | From (m) | To (m) | Thickness (m) | Cu (%) | Au (g/t) | Zn (%) | Ag (g/t) | Pb (%) | Copper Equivalency (%) ^{(1) (2)} | Approx. True Thickness (m) |

(2) Metal equivalency adjusted for metal recoveries based on detailed metallurgical data from Feasibility Study filed on SEDAR, effective data October 26, 2021. The report is titled – “NI 43-101 Technical Report, Feasibility Study, Curipamba El Domo Project, Central Ecuador”.

Drill hole CURI-396 intersected mineralized, tuff-sized volcanic sediment that transitioned into semi-massive to massive sulphide mineralization from 66.97 to 70.22 metres, grading 0.97% copper, 1.88 g/t gold, 3.78% zinc, 67.5 g/t silver, and 0.29% lead. A higher-grade subsection occurs from 69.26 to 70.22 metres, grading 1.58% copper, 1.52 g/t gold, 7.55% zinc, 65.2 g/t silver and 0.24% lead.

| Drill Hole | From (m) | To (m) | Thickness (m) | Cu (%) | Au (g/t) | Zn (%) | Ag (g/t) | Pb (%) | Copper Equivalency (%) ^{(1) (2)} | Approx. True Thickness (m) |

Drill hole CURI-395 was designed to test the outer margins of the Indicated category material along a fault and to further assess the underground development geology. This drill hole confirmed modelling previously done in this portion of the deposit and provides additional geological control for future modelling and engineering studies. CURI-395 did not yield any substantial results.

News Release: 22-18

Ticker Symbols: ADZN (TSXV), ADVZF (OTCQX), SRL (TSXV) SRLZF (OTCQB)

All results from the infill drilling program are to be used in updating the underground portion of the Mineral Resource estimate for El Domo in 2023, which will be part of a future feasibility study that will integrate the development a potential underground operation in addition to the planned open pit (see August 29, 2022 news release). Figure 1 illustrates the drill locations for the results of the five drill holes outlined in this news release. Drill collar location coordinates are summarized for the infill and geomechanical drilling programs in Table 1 at the end of this news release.

For reference, the last Mineral Resource estimate completed in accordance with NI 43-101 for El Domo was published as part of the Feasibility Study report titled: "NI 43-101 *Technical Report, Feasibility Study, Curipamba El Domo Project, Central Ecuador*", with an effective date of October 26, 2021 on SEDAR.

Update on Agua Santa Target

2021 regional drilling on the Agua Santa target, located 4.5 kilometres to the southwest of El Domo, successfully completed a total of 2,818 metres in 11 drill holes (CREG-008 to CREG-018) in the Agua Santa target area. VMS mineralization was identified in several of the drill holes targeting a Mobile MT ("MMT") airborne geophysical anomaly that coincided with both favourable geology and surface geochemistry results from prospecting in nearby creek beds. The Agua Santa target area remains one of the most prospective volcanic environments outside of El Domo for identifying new VMS occurrences, given that the first drill hole at Agua Santa, CREG-008, intersected three separate intervals of semi-massive sulphide to massive sulphide mineralization from 60.52 to 66.86 metres, grading 1.77% copper, 1.46 g/t gold, 7.45% zinc, 23.2 g/t silver and 0.24% lead. The mineralization is hosted within variably mineralized volcanoclastic rocks, noting the highly fragmental appearance of the mineralization suggests it has been reworked from a potential collapse of the massive sulphide lens downslope. CREG-008 also had in the footwall several broad zones of pyritic stringer stockwork in massive mafic volcanic rocks were observed with focused hydrothermal alteration halos directly around the mineralization (see October 18, 2021 news release).

Drill hole CREG-009 intersected two zones of disseminated to semi-massive sulphide from 28.86 to 32.00 metres, and from 69.47 to 75.20 metres with only the second interval having any results from 72.27 to 75.20 metres, grading 0.25% copper, 0.13 g/t gold, and 0.7 g/t silver. Further down in the footwall there were three separate intervals of low-grade pyritic stockwork. The first interval is from 133.72 to 138.00 metres, grading 0.96% copper, 0.17 g/t gold and 1.0 g/t silver. The second interval is from 152.72 to 154.81 metres, grading 0.55% copper, 0.04 g/t gold and 0.3 g/t silver. The final interval is from 170.18 to 171.26 metres, grading 1.16% copper, 0.05 g/t gold, and 1.4 g/t silver. None of the low-grade stockwork occurrences had appreciable zinc or lead mineralization.

CREG-010 intersected a wide, low-grade zone of heavily disseminated to semi-massive sulphide mineralization from 41.00 to 52.04 metres. Mineralization yielding metal values occurs from 44.50 to 50.57 metres, grading 0.15% copper, 0.31 g/t gold, 0.37% zinc, and 1.7 g/t silver. A higher-grade subset in the semi-massive sulphide mineralization was intersected from 44.50 to 45.12 metres 0.88% copper, 1.32 g/t gold, 2.26% zinc, 14.8 g/t silver and 0.01% lead.

| Drill Hole | From (m) | To (m) | Thickness (m) | Cu (%) | Au (g/t) | Zn (%) | Ag (g/t) | Pb (%) | Approx. True Thickness (m) |
|------------------|----------|--------|---------------|--------|----------|--------|----------|--------|----------------------------|
| CREG-010 | 44.50 | 50.57 | 6.07 | 0.15 | 0.31 | 0.37 | 1.7 | 0.00 | TBD |
| <i>including</i> | 44.50 | 45.12 | 0.62 | 0.88 | 1.32 | 2.26 | 14.8 | 0.01 | TBD |

(1) This is an early-stage exploration project, meaning geological modeling has not determined the orientation of stratigraphy to accurately determine an approximate true thickness for lithologies and mineralization

News Release: 22-18

Ticker Symbols: ADZN (TSXV), ADVZF (OTCQX), SRL (TSXV) SRLZF (OTCQB)

Drill hole CREG-011 intersected numerous zones of heavily disseminated to semi-massive and massive sulphide mineralization between 29.75 to 52.30 metres. Given the nature of the mineralization, it is likely these are fragments of mineralization that were redeposited while the mineralizing, hydrothermal system was still active. The main interval of semi-massive is from 40.35 to 43.70 metres, grading 0.76% copper, 1.39 g/t gold, 4.29% zinc, 12.5 g/t silver, and 0.17% lead. There are two higher-grade subsections, the first occurring from 40.35 to 40.70 metres, grading 4.76% copper, 0.51 g/t gold, 0.91% zinc, 28.0 g/t silver and 0.03% lead, and the second occurring from 41.62 to 42.30 metres, grading 0.37% copper, 5.67 g/t gold, 19.92% zinc, 39.3 g/t silver and 0.77% lead. A final mineralized interval in this wide section of was intersected from 51.70 to 52.30 metres, grading 0.10% copper, 0.45 g/t gold, 0.66% zinc, 17.5 g/t silver and 0.12% lead.

| Drill Hole | From (m) | To (m) | Thickness (m) | Cu (%) | Au (g/t) | Zn (%) | Ag (g/t) | Pb (%) | Approx. True Thickness (m) |
|------------------|----------|--------|---------------|--------|----------|--------|----------|--------|----------------------------|
| CREG-011 | 40.35 | 43.70 | 3.35 | 0.76 | 1.39 | 4.29 | 12.5 | 0.17 | TBD |
| <i>including</i> | 40.35 | 40.70 | 0.35 | 4.76 | 0.51 | 0.91 | 28.0 | 0.03 | TBD |
| <i>Including</i> | 41.62 | 42.30 | 0.68 | 0.37 | 5.67 | 19.92 | 39.3 | 0.77 | TBD |
| | 51.70 | 52.30 | 0.60 | 0.10 | 0.45 | 0.66 | 17.5 | 0.12 | TBD |

(1) This is an early-stage exploration project, meaning geological modeling has not determined the orientation of stratigraphy to accurately determine an approximate true thickness for lithologies and mineralization

Drill hole CREG-012 intersected a weakly mineralized, epiclastic, lapilli-tuff-sized volcanic sediment that resembles the Grainstone unit in the immediate hanging wall of El Domo. This unit was intersected from 57.76 to 59.77 metres, grading 0.08% copper, 0.74 g/t gold, 0.37% zinc, 5.6 g/t silver, and 0.02% lead. Further downhole, a narrow zone of pyritic stockwork, locally semi-massive sulphide, was intersected from 147.97 to 149.40 metres, grading 0.05% copper, 0.11 g/t gold, 0.42% zinc, 10.1 g/t silver, and 0.13% lead.

| Drill Hole | From (m) | To (m) | Thickness (m) | Cu (%) | Au (g/t) | Zn (%) | Ag (g/t) | Pb (%) | Approx. True Thickness (m) |
|-----------------|----------|--------|---------------|--------|----------|--------|----------|--------|----------------------------|
| CREG-012 | 57.76 | 59.77 | 2.01 | 0.08 | 0.74 | 0.37 | 5.6 | 0.02 | TBD |
| | 147.97 | 149.40 | 1.43 | 0.05 | 0.11 | 0.42 | 10.1 | 0.13 | TBD |

(1) This is an early-stage exploration project, meaning geological modeling has not determined the orientation of stratigraphy to accurately determine an approximate true thickness for lithologies and mineralization

Drill holes CREG-013 to CREG-018 did not yield any significant results, however, they did provide invaluable geological information about the volcanic architecture of the favourable VMS environment in the Agua Santa target area that will be used in future exploration programs to continue targeting for new discoveries. However, although CREG-018 did not have any significant results, it did undercut VMS-related mineralization found on surface while mapping drainages and creek bottoms. It is unclear due to the lack of exposure if this mineralization is from the newly identified Agua Santa target or from another source nearby. Six samples were collected from the exposed surface mineralization that appears to be fragmental massive sulphide boulders hosted in volcanic rocks, which supporting observations and the current interpretation of the mineralization identified in drilling (CREG-008 to CREG-012). Results for copper from those six samples ranged from 3.99% to 14.70% with two samples being over 5.00% and only one sample being over 10.00%. The six samples were also enriched in gold, ranging from 1.97 g/t to 11.40 g/t with only one sample being over 10.00 g/t. Similarly, the six samples yielded elevated silver values ranging from 74.6 g/t to 120 g/t with only two samples being over 100.0 g/t. For zinc, it ranged from 27.52% to 46.30% with five being over 30.00% and only one sample being over 40.00%. Lead is the least enriched metal at Agua Santa ranging from 0.10% to 1.20% in the six samples with only one sample over 1.00%.

Date: October 17, 2022

News Release: 22-18

Ticker Symbols: ADZN (TSXV), ADVZF (OTCQX), SRL (TSXV) SRLZF (OTCQB)

All results from the exploration drilling program at Agua Santa continue to be used in updating the target generation initiative for the greater Curipamba project in order to further define prospectivity for identifying new VMS occurrences in the favourable volcanic rocks around El Domo. The six mineralized samples near the CREG-018 collar location lend support that there may yet be additional high-grade VMS mineralization in the area, which is why Agua Santa remains one of the highest rated targets for regional exploration at the Curipamba project. Figure 2 illustrates the drill locations for Agua Santa. Drill collar location coordinates are summarized for the exploration drilling in Table 2 at the end of this news release.

Technical Information and QAQC

The Curipamba project work program is being managed and reviewed by Vice President Exploration, Jason Dunning, M.Sc., P.Geo., a Qualified Person within the meaning of NI 43-101. Salazar staff collect and process samples that are securely sealed and shipped to Bureau Veritas ("BV") in Quito for sample preparation that includes crushing and milling to prepare pulps that are then split for shipment to their facility in Vancouver, Canada for analysis. All assay data have undergone internal validation of QAQC; noting there is an established sampling control program with blind insertion of assay blanks, certified industry standards and sample duplicates for the Curipamba project. A QAQC program is also in place at BV and includes insertion of blanks, standards, and duplicate reanalysis of selected samples. BV's quality system complies with the requirements for the International Standards ISO 9001:2000 and ISO 17025: 1999. At BV, samples from regional drilling have silver and base metals analyzed by a modified ore grade 24-element aqua regia technique with ICP-ES finish. Gold is analyzed by fire assay fusion with AAS finish. Overlimit protocols are in place for gold, silver, copper, lead, and zinc.

Qualified Person

The technical information of this news release has been reviewed and verified as accurate by Mr. Jason Dunning, M.Sc., P.Geo., Vice President Exploration for Adventus Mining, a non-Independent Qualified Person, as defined by NI 43-101.

About Adventus Mining

Adventus Mining Corporation is an Ecuador-focused copper-gold exploration and development company. Adventus Mining is majority owner of the 215 sq. km Curipamba copper-gold project, which has a completed feasibility study on the shallow and high-grade El Domo deposit. In addition, Adventus Mining is engaged in a country-wide exploration alliance in Ecuador, which has incorporated the Pijili and Santiago copper-gold porphyry projects to date. Outside of Ecuador, Adventus Mining owns an exploration project portfolio in Ireland with South32 Limited as the funding participant. Its strategic shareholders include Altius Minerals Corporation, Greenstone Resources LP, Wheaton Precious Metals Corp., and the Nobis Group of Ecuador. Adventus Mining is based in Toronto, Canada, and is listed on the TSX Venture Exchange under the symbol ADZN and trades on the OTCQX under the symbol ADVZF.

About Salazar

Salazar Resources Limited is focused on creating value and positive change through discovery, exploration, and development in Ecuador. The team has an unrivalled understanding of the geology in-country and has played an integral role in the discovery of many of the major projects in Ecuador, including the two newest operating gold and copper mines. Salazar Resources has a wholly owned pipeline of copper-gold exploration projects across Ecuador with a strategy to make another commercial discovery and farm-out non-core assets. The Company actively engages with Ecuadorian communities and together with the Salazar family it co-founded The Salazar Foundation, an independent non-profit organization dedicated to sustainable progress through economic development. The Company already has carried interests in three projects. At its maiden discovery, Curipamba, Salazar Resources has a 25% stake fully carried through to production. At two copper-gold porphyry projects, Pijili and Santiago, the Company has a 20% stake fully carried through to a construction decision.

Neither the TSX Venture Exchange nor its Regulation Services Provider (as that term is defined in the policies of the TSX Venture Exchange) accepts responsibility for the adequacy or accuracy of this news release.
